HOW TO

Connect a Coax Antenna

Prepare the coaxial cable using a wire stripper or knife, carefully cut the outer sheath "A" of the cable, leaving the inner braid "B" and the central conductor "C" intact.

Unfold the braided shield "B" of the cable and fold it back over the outer sheath.

Remove any foil or tape underneath the braid.

Trim the inner dielectric (the white plastic layer) so that about 7-8 mm of the central conductor "D" is exposed.

Ensure the braid does not touch the inner conductor, as this will cause a short circuit.

Insert the core "D" into your control board antenna core and terminate. Insert the end of the shield "B" into the control board antenna shield and terminate.
